

K-Citrate

Liquid Potassium Citrate

K-Citrate is a high analysis pH buffered liquid potassium complexed with citric and fulvic acids.

K-Citrate has a vastly accessible form of potassium and is particularly useful for foliar fertilising fruit, vegetable and grain crops during the potassium – hungry fruit/seed-fill stage, or indeed any crop where potassium is required.

Organic chelating and complexing agents are used in the manufacturing of this product to facilitate efficient absorption and translocation in plant tissue, resulting in fast uptake and response.

Potassium Citrate	pH
33.2 %	7-8
